

## ft\_linear\_regression

An introduction to machine learning

*Summary:* In this project, you will implement your first machine learning algorithm.

*Version:* 4.1

# Chapter I

## Foreword

What I think is the best definition for machine learning:

"A computer program is said to learn from experience E with respect to some class of tasks T and performance measure P, if its performance at tasks in T, as measured by P, improves with experience E."

Tom M. Mitchell

# **Chapter II**

## **Introduction**

Machine learning is a growing field of computer science that may seem a bit complicated and reserved only to mathematicians. You may have heard of neural networks or k-means clustering and don't understand how they work or how to code these kinds of algorithms...

But don't worry, we are actually going to start with a simple, basic machine learning algorithm.

# Chapter III

## AI Instructions

### ● Context

AI is now a powerful coding partner — alongside your peers — for tackling large and demanding projects. You will guide it through both technical and non-technical aspects of your work.

AI tools can boost your efficiency and improve the quality of your output, but you should be able to dive deep into any part of the project without relying on them.

Your AI partner supports you, but you remain fully responsible for making informed technical decisions and to clearly explain and defend them.

### ● Main message

- 👉 Strive for a mature and responsible use of AI.
- 👉 Never let AI take responsibility for decisions — especially when it lacks awareness of your goals, constraints, or team dynamics.
- 👉 Maintain creativity, innovation, and human oversight through active collaboration with your peers. AI is trained on existing data and rarely generates truly new ideas.
- 👉 Stay informed about emerging trends and be ready to adapt to new concepts and technologies.

### ● Learner rules:

- Maintain intellectual leadership over your projects and make your own informed decisions.
- Prioritise the collective intelligence of your team and peers.
- Actively stay informed about the ongoing evolution of AI technologies.

## ● Phase outcomes:

- AI engineering skills.
- Increased efficiency.
- Greater reliability and quality.
- A pioneering mindset.

## ● Comments and examples:

- Your peers can identify trade-offs, question assumptions, and help you improve. The first answer from an AI might not be the best — it may lack efficiency, security, or real added value. Now more than ever, you should rely on your peers.
- AI can make you faster, but your peers make you better. Collaboration, discussion, and mutual challenge are key to success.
- Be transparent about how AI was used in your projects, and clearly identify what was generated by AI tools.

### ✓ Good practice:

I asked AI to help generate unit tests for my API. I reviewed them with my teammate, and we adjusted them for edge cases. It saved time, and we both learned something new.

### ✗ Bad practice:

I had AI generate the entire architecture of my project. It “works,” but when I’m asked to explain design decisions during the peer review or in front of a customer, I cannot. I lose credibility and I fail.

# Chapter IV

## Objective

The aim of this project is to introduce you to the basic concepts behind machine learning. For this project, you will have to create a program that predicts the price of a car by using a [linear function](#) trained with a [gradient descent algorithm](#).

We will work on a precise example for the project, but once you're done you will be able to use the algorithm with any other dataset.

# Chapter V

## General instructions

In this project, you are free to use whatever language you want.

You are also free to use any libraries you want as long as they do not do all the work for you. For example, the use of Python's `numpy.polyfit` is considered cheating.

You should use a language that allows you to easily visualize your data : it will be very helpful for debugging.

# Chapter VI

## Mandatory part

You will implement a simple linear regression with a single feature - in this case, the mileage of the car.

To do so, you need to create two programs:

- The first program will be used to predict the price of a car for a given mileage. When you launch the program, it should prompt you for a mileage, and then give you back the estimated price for that mileage. The program will use the following hypothesis to predict the price :

$$\text{estimatePrice}(\text{mileage}) = \theta_0 + (\theta_1 * \text{mileage})$$

Before running the training program, theta0 and theta1 will be set to 0.

- The second program will be used to train your model. It will read your dataset file and perform a linear regression on the data.

Once the linear regression has completed, you will save the variables theta0 and theta1 for use in the first program.

You will be using the following formulas :

$$\text{tmp}\theta_0 = \text{learningRate} * \frac{1}{m} \sum_{i=0}^{m-1} (\text{estimatePrice}(\text{mileage}[i]) - \text{price}[i])$$

$$\text{tmp}\theta_1 = \text{learningRate} * \frac{1}{m} \sum_{i=0}^{m-1} (\text{estimatePrice}(\text{mileage}[i]) - \text{price}[i]) * \text{mileage}[i]$$

I let you guess what m is :)

Note that the estimatePrice is the same as in our first program, but here it uses your temporary, most recently computed theta0 and theta1.

Also, don't forget to simultaneously update theta0 and theta1.

# Chapter VII

## Bonus part

Here are some bonuses that could be very useful:

- Plotting the data into a graph to see their distribution.
- Plotting the line resulting from your linear regression into the same graph, to see the result of your hard work!
- A program that calculates the precision of your algorithm.

The bonus part will only be assessed if the mandatory part is PERFECT. Perfect means the mandatory part has been integrally done and works without malfunctioning. If you have not passed ALL the mandatory requirements, your bonus part will not be evaluated at all.

# **Chapter VIII**

## **Submission and peer-evaluation**

Turn in your assignment in your **Git** repository as usual. Only the work inside your repository will be evaluated during the defense. Don't hesitate to double-check the names of your folders and files to ensure they are correct.

Here are the points that your peer reviewer will have to check :

- The absence of libraries that do the work for you
- The use of the specified hypothesis
- The use of the specified training function
